

iFrame Hosted Pages

You need a means to accept payment information, whether its from your web site, from your mobile application or from your installed application. Using the Intrix iFrame Hosted Pages, you can rely on Intrix to securely manage the process of accepting the cardholder data, and authorizing the transaction. This approach can also be used when a merchant needs to enter payment instrument data in the eCommerce, MOTO and Retail arenas using web-based or installed applications.

For example, when the cardholder is ready to checkout when making an online purchase, he or she sees a payment form in a frame on the merchants web page. The cardholder then enters his or her payment card information directly into the Intrix page. Once the Intrix authorizes the transaction, the cardholder is directed to a screen or web page with transaction results. With the Intrix solution, this process is seamless to the cardholder. There is no redirection, no other URL showing up in the customers browser.

By doing this, the merchant's web application is no longer transmitting, storing, or processing cardholder data since the cardholder provides that information directly to Intrix via the iFrame Hosted Payment Page.

- ◆ Easy to Implement
- ◆ Reduce Development Expense
- ◆ Eliminate PA-DSS or PCI-DSS Scope
- ◆ Improve the Security of Your Application by Doing LESS
